I. Introduction

A. Background of the Study

B. System Overview

C. Problem Statement

D. Objectives

To design and develop a desktop based Travel Agency Management System using Java Swing and an embedded Apache Derby database that manages the core internal operations of a travel agency, including customer records, destinations, travel packages, bookings, and payment transactions in a centralized and organized digital platform that can be used offline.

E. Scope and Limitations

This desktop-based Travel Agency Management System, built using Java Swing and an embedded Apache Derby database, is designed to handle the core internal operations of a travel agency. It focuses on essential data management and local transaction recording to demonstrate fundamental database concepts, role-based access, and user interface design. As an academic project, the application is strictly confined to offline, localized data entry and retrieval, avoiding complex network integrations or live data synchronization.

Included Features

- User login
- Admin account management
- Customer profile management
- Destination management
- Travel package management
- Booking management
- Payment tracking
- Search functionality
- Database CRUD operations
- Summary report viewing
- Logout

Excluded Features

- Live Booking & API Integrations
- Web or Mobile Accessibility
- Automated Notifications
- Advanced Analytics
- Multi-User Network Concurrency
- Real-Time Admin or Technical Support

F. Significance of the Project

G. Definition of Terms

II. System Analysis and Design

A. Existing System

B. Proposed System

C. Functional Requirements

D. Non-Functional Requirements

E. System Users
